MCC. The scalable information system

Product- description

MCC. The scalable information system

Solutions for specific departments or a comprehensive HIS: MCC, the scalable information system developed by MEIERHOFER, is a complete system for healthcare facilities that can be adapted to the special needs of any hospital. MCC features optimized process structures, functional depth and advanced integration scenarios, so it simplifies tasks for physicians and the nursing staff, improves patient care and offers investment security for management.

From surgical centers to university hospitals

The thing that makes the system special is its scalability: MCC is currently in use at some 22,000 workstations in 200 facilities throughout Europe, from surgical centers to regional and university hospitals. It can be used as a complete system or as a specialty solution of any size.

MCC meets the needs of specialty departments, so it can be used as a highly functional department solution, e.g. for heart, thorax and vascular surgery or for radiology. The company also developed MCC.OP, a leading system for process-oriented OR management. The MCC information system can

be introduced gradually and economically in keeping with a hospital's specific requirements.

Simplifies work by optimizing processes

One of the system's distinguishing features is its functional depth. Besides networking physicians, the nursing staff and administration, it also simplifies and shortens workflows. The system uses program tools such as to-do lists and control mechanisms to simplify navigation, support the documentation process and check it for completeness. Graphic daily, weekly and monthly overviews, the ability to directly compare target and actual values, capacity administration in the OR and bed scheduling optimize work for the user. It improves treatment quality and cuts costs.

Product- description

Once the user has logged on at the MCC workstation, the MCC portal solution allows the user to access all functions and information that are assigned to his or her role. Similar to the Internet, information is linked to hyperlinks, and the user navigates simply and intuitively through electronic patient records. External services such as medical literature (Medline) can be made available to the physician via web integration.

Patient safety due to informed personnel

MCC provides time-saving, effective support, so physicians and the nursing staff have more time for their patients.

The system gives all users a complete overview of all the facts and findings documented for a given patient at any time. Depending on the diagnoses and recommended therapies, necessary patient-care measures are immediately visible or can be recommended.

Pioneering technologies, sound investment

MCC is based on Microsoft's .NET architecture, so it supports ongoing technological progress and protects your investment. Its innovative architecture is also a platform that supports future technical development without expensive retrofitting.

As a system that documents patient care, MCC also supports the integration of systems from other manufacturers. MCC has above average integration depth, particularly in conjunction with products from SAP: An integration scenario certified by SAP keeps data between all medical and administrative functions synchronized at all time.

Because MCC is scalable and can be integrated into other systems, healthcare facilities can combine it with the widest variety of solutions. This allows them to use the „best-of-breed“ approach when selecting suppliers and creating an IT structure that best suits their facility.
